

Capital Report

Economic Feasibility Analysis · ARA vs. Project 2025 vs. DNC 2024

Neutral, Favorable, and Poor Economic Conditions · Tier-Rated Sources · Methodology Cross-Referenced · May 2026

v3 rebuild note. This edition aligns to ARA Framework v26 (**average 7.70**; 65 proposals; Phase I 37, Phase II 21, Phase III 7; 34 legislative / 31 executive; 12 bills) and to **Scoring Methodology v1.1** (GP / UT — US Transition Difficulty / B). Citations are tier-rated (A = authoritative non-partisan; B = peer-reviewed or major think-tank; C = advocacy or partisan-aligned, used with explicit framing; D = outlier, contextual only) and cross-referenced to the **Source Reference Guide v8** by source number. The fiscal-modeling analysis here uses CBO / JCT / PWB / CRFB conventions; this is independent of, and complementary to, the policy-scoring methodology used in the Framework. Both are required: a framework that scores well on policy must also be fiscally feasible. This report is the fiscal-feasibility half of that test. **Calibrated conservatism applies throughout:** where modelers diverge, central estimates default to the lower revenue / higher cost figure.

Executive Summary

This document is a sourced economic and fiscal feasibility analysis comparing the American Renewal Agenda (ARA), Project 2025/Agenda 47, and the DNC 2024 platform across three economic scenarios. Sources draw from the Congressional Budget Office, Joint Committee on Taxation, Penn Wharton Budget Model, Committee for a Responsible Federal Budget, Peterson Institute for International Economics, Tax Foundation, Tax Policy Center, Yale Budget Lab, NBER peer-reviewed economics, and Federal Reserve research notes.

The single most important finding

Across mainstream-modeler consensus as of May 2026, **Project 2025 / OBBBA is the most fiscally damaging package across all three scenarios — and that finding has strengthened, not weakened, since v2.** The enacted One Big Beautiful Bill Act (Public Law 119-21, July 4, 2025) is firmly scored at \$4.1T (with interest, 10-year) per CBO's February 2026 Outlook, and every credible model except Tax Foundation finds dynamic feedback raises rather than lowers cost. The DNC 2024 platform remains the lowest-variance, lowest-effect package. The ARA holds the highest fiscal upside in poor conditions because government-purchase components — infrastructure investment, public health restoration, antitrust enforcement — retain recession-period multipliers above one, though v3 hedges the broader countercyclical claim explicitly where the multiplier literature has narrowed (see §1.5).

Mainstream modelers converge on the directional rankings even where they disagree on magnitudes. Where genuine economic disagreement exists, this report flags it. All major figures are presented with low / central / high ranges per CRFB convention.

△ PRINCIPAL CORRECTIONS FROM v2

(1) OBBBA is enacted, not projected. Reframed as Public Law 119-21 (July 4, 2025) throughout, anchored on CBO Pub. 61882 (Feb 2026). **(2) Tariff revenue projection cut ~75%.** February 20, 2026 Supreme Court ruling struck IEEPA tariffs (6-3); v2's \$2.0-3.3T projection partially superseded by post-SCOTUS \$668B-\$1.1T over the decade. The PWB "−6% GDP / \$22K lifetime household loss" headline is now reframed as counterfactual to a never-implemented April 2025 schedule. **(3) Federal workforce cost is \$165.6B economy-wide** per Partnership for Public Service April 2026, not \$71B (which remains the narrower fiscal subset). A fourth methodology update — Ramey 2024-2025 on transfer multipliers — is engaged directly in §1.5.

Part 1 — Methodology and Scoring Approach

1.1 The Four-Tier Scoring Ecosystem

CBO produces official 10-year cost estimates against current-law baselines, with 30-year long-term outlooks for major entitlement-style proposals. CBO's "conventional" scoring holds GDP fixed; macroeconomic feedback ("dynamic scoring") is added only for legislation crossing a 0.25%-of-GDP threshold under House rules. For OBBBA in 2025, CBO's dynamic feedback offset only \$85B of a \$2.4T conventional deficit score — approximately 3.5% of the total. The integrated post-enactment baseline is now CBO Pub. 61882 (Feb 11, 2026), which is the standard reference point for OBBBA's fiscal effects throughout this report.

[TIER A] CBO, "How CBO Prepares Baseline Projections and Cost Estimates" — CBO conventional scoring holds GDP fixed; dynamic scores apply only for major legislation exceeding 0.25%-of-GDP threshold. (SRG #24) <cbo.gov/publication/53550>

[TIER A] CBO Working Paper 2026-01, "Key Methods That CBO Used to Estimate the Macroeconomic Effects of the 2025 Reconciliation Act" (Feb 20, 2026) — Documents the formal modeling blend: short-term Keynesian for 2025–26; transitioning weights (0.75 / 0.50 / 0.25) across 2027–2029; long-run Solow thereafter. (SRG #300) <cbo.gov/publication/61257>

JCT scores tax legislation using three macro models. **The Tax Policy Center** runs microsimulation on the IRS Statistics of Income file with capital-gains realization elasticities of approximately -0.7 long-run. **Penn Wharton Budget Model (PWBM)** uniquely couples microsimulation with a dynamic OLG general-equilibrium model, publishing both conventional and dynamic estimates by default. **CRFB** aggregates outputs from multiple models into "central, low, and high" estimates — the standard format for comparative platform analyses.

[TIER A] Penn Wharton Budget Model — OLG model documentation; couples microsimulation with dynamic OLG general-equilibrium model. (SRG #26) <budgetmodel.wharton.upenn.edu/model/dynamic-olg/>

[TIER A] CRFB, "Fiscal Impact of the Harris and Trump Campaign Plans" (October 2024) — Central / low / high ranges: Harris +\$3.95T (range \$0.3T–\$8.3T); Trump +\$7.75T (range \$1.65T–\$15.55T). Debt-to-GDP: 125% current law, 133% Harris, 142% Trump by FY2035. (SRG #27) <crfb.org/papers/fiscal-impact-harris-and-trump-campaign-plans>

1.2 Static vs. Dynamic Scoring — The Consensus

The mainstream consensus: tax cuts produce only partial revenue feedback, not full self-financing. This consensus has hardened, not softened, since v2. Mankiw–Weinzierl (2006) found approximately 50% self-financing for capital tax cuts and 17% for labor tax cuts using standard neoclassical parameters. The newer Chodorow-Reich-Smith-Zidar-Zwick analysis of TCJA puts the realized revenue feedback at only ~5%. JCT's macroeconomic analysis of OBBBA puts the feedback offset at ~7% of the static cost.

[TIER A] Mankiw & Weinzierl (2006), *Journal of Public Economics* — Capital tax cut self-financing ~50%; labor ~17%. Standard neoclassical growth model. (SRG #28)

[TIER A] Chodorow-Reich, Smith, Zidar, Zwick, NBER WP 32180 (2024), "Tax Policy and Investment in a Global Economy" — TCJA tax revenue feedback offsets only ~5% of direct revenue cost. By extension, OBBBA's similar provisions will not pay for themselves either. (SRG #301) <nber.org/papers/w32180>

[TIER A] JCT JCX-25-25 (May 14, 2025), "Macroeconomic Analysis of the Tax Provisions" — GDP +0.2% early years rising to +0.4% over 2030–2034; dynamic feedback offsets ~7% of static cost. (SRG #302) <jct.gov/publications/2025/jcx-25-25/>

[TIER A] Bipartisan Policy Center, "The 2025 Tax Debate: Dynamic Scoring" — Based on BPC analysis of nearly 20 macroeconomic estimates from JCT dating back to 2003, no tax cut has been found to fully or mostly pay for itself. (SRG #29) <bipartisanpolicy.org/explainer/the-2025-tax-debate-dynamic-scoring/>

Doug Holtz-Eakin (former CBO Director, who produced CBO's first dynamic score) stated of OBBBA: "*This bill has essentially no impact on the trend rate of growth. They're talking about moving the growth rate to 3%. That's numerically implausible.*"

[TIER B] Concord Coalition / Holtz-Eakin commentary (May 2025). (SRG #30) <concordcoalition.org/facing-the-future/douglas-holtz-eakin-may-2025/>

1.3 Fiscal Effect (FE) Rating Key — Used Throughout This Document

Code	Label	Definition
Revenue+	Revenue-positive	Generates net positive federal revenue over 10-year window. Best-case fiscal outcome.
Rev+/Cost	Revenue-positive with upfront cost	Requires upfront investment but produces net positive returns within 10 years. Self-funding or better over time.
Cost-Net	Net cost with partial offset	Federal expenditure with significant economic or welfare offsets that partially compensate. Not self-funding but produces documented returns beyond the budget window.
High Cost	Significant net federal cost	Large federal expenditure with limited direct fiscal offset. May produce welfare gains not captured in the budget window.
Welfare+	Welfare gain, indirect fiscal	Not a direct budget measure but produces documented economic welfare gains (GDP, wages, consumer surplus) that increase the tax base over time.

1.4 Calibrated Conservatism and Cross-References to the Wider Ecosystem

Where mainstream modelers diverge on magnitude, this report defaults to the lower revenue / higher cost figure as its central estimate. This is the same *calibrated conservatism* principle declared in Scoring Methodology v1.1: where ambiguous, assign the score that demands more of the proposal, not less. In practice, the IRS enforcement central case uses CBO's \$124B net rather than Treasury's \$561B; the OBBBA central case uses CBO's \$4.1T-with-interest rather than Tax Foundation's narrower static figure; the public-option central case uses CBO 2013's \$158B rather than Urban's \$388B. The full methodology rubric is documented separately:

[TIER A] REF_RDNC_ScoringMethodology_2026 v1.1 — Three-axis policy scoring (GP / UT / B); comparator nations; evidence tiers A-D; calibration examples; limitations. Companion document to the policy framework, distinct from the fiscal methodology in this report.

[TIER A] REF_RDNC_SourceReferenceGuide_2026 v8 — 297 sources across 18 categories; five completed audits; ecosystem-path mapping. All sources cited in this report carry their SRG number for direct cross-reference.

1.5 Methodology Limits — The Multiplier Literature, Honestly

The single most consequential change in the academic fiscal-multiplier literature between v2 (April 2026) and v3 (May 2026) is a credible, well-sourced challenge to the assumption that *temporary cash transfers* have large multipliers in recessions. v2's "ARA is countercyclical" framing rested partly on this assumption. v3 engages the challenge directly rather than route around it.

What changed in the literature

Valerie Ramey's 2024–2025 work, including the Orchard–Ramey–Wieland NBER paper (rev. October 2024) and her 2025 IMF Economic Review article, examines four major temporary-transfer episodes (US 2001 rebate, US 2008 rebate, Singapore, Australia) and finds general-equilibrium consumption multipliers from temporary rebates below 0.2 — concluding that temporary cash transfers "*likely provided little or no macroeconomic stimulus in advanced economies.*" If this finding holds, transfer-based countercyclical claims (including parts of v2's ARA framing) need to shrink materially.

[TIER A] Orchard, Ramey & Wieland, NBER WP 31584 (rev. October 2024) — General-equilibrium consumption multipliers from temporary cash transfers below 0.2 across four case studies. (SRG #303) nber.org/papers/w31584

[TIER A] Ramey, "Do Temporary Cash Transfers Stimulate the Macroeconomy? Evidence from Four Case Studies," *IMF Economic Review* (2025) — Synthesis: temporary cash transfers likely provide little or no macroeconomic stimulus in advanced economies.

Directly challenges Capital Report v2's countercyclical-transfer claim. (SRG #304)

The Auerbach–Gorodnichenko–McCrory–Murphy NBER paper (revised May 2025) on COVID-19 fiscal multipliers reaffirms that *government-purchase* multipliers remain larger in recessions than expansions (~2.0 vs. <1.0), but with a critical qualifier: supply constraints (such as those during lockdowns) reduce multipliers even in recession. The Jo–Zubairy 2025 paper in AEJ-Macroeconomics narrows the state-dependent claim further, finding that

government-spending multipliers are larger specifically in *low-inflation* recessions, with the mechanism being downward nominal wage rigidity. The current US environment — post-2022 high-inflation expectations — is one in which Jo-Zubairy would predict diminished recession multipliers in any near-term downturn.

[TIER A] Auerbach, Gorodnichenko, McCrory & Murphy, "Fiscal Multipliers in the Covid-19 Recession," NBER WP 29531 (rev. May 2025) — Reaffirms larger multipliers in recessions vs. expansions (~2.0 vs. <1.0); supply constraints reduce multipliers even in recession. (SRG #305) <nber.org/papers/w29531>

[TIER A] Jo & Zubairy, "State-Dependent Government Spending Multipliers," *AEJ Macroeconomics* 17(1), Jan 2025 — Spending multipliers larger specifically in low-inflation recessions (downward nominal wage rigidity mechanism). **Critical caveat: current high-inflation environment would suppress multipliers in any near-term recession.** (SRG #306)

How v3 responds

Three responses, applied throughout Parts 2 through 5: **(a)** Where ARA components rely on transfer-based stimulus (e.g., rebates, temporary tax credits), the multiplier assumption is hedged explicitly with reference to Ramey 2024–2025; the upper bound on countercyclical benefit is lowered. **(b)** Where ARA components are *government-purchase* driven (infrastructure, public health restoration, public-option administration), the multiplier assumption remains defensible — Auerbach-Gorodnichenko 2025 still supports recession multipliers in the 1.5–2.0 range with the supply-constraint caveat. The Global Infrastructure Hub meta-analysis of 3,000+ estimates supports ~0.8 within one year, ~1.5 within two-to-five years, ~1.6 in contractionary phases — directionally consistent. **(c)** Part 5's "Poor Conditions" scenario carries an explicit footnote flagging that the current high-inflation environment may suppress recession multipliers per Jo-Zubairy 2025, narrowing the ARA countercyclical advantage in a near-term downturn (without eliminating it).

[TIER B] Global Infrastructure Hub meta-analysis (3,000+ estimates) — Public infrastructure multiplier ~0.8 within 1 year; ~1.5 within 2–5 years; ~1.6 in contractionary phases. (SRG #307)

<[github.org/infrastructure-monitor/insights/fiscal-multiplier-effect-of-infrastructure-investment/](https://github.com/infrastructure-monitor/insights/fiscal-multiplier-effect-of-infrastructure-investment/)>

The result is a more honest report. The directional finding — that ARA retains the highest recession resilience of the three platforms because of its government-purchase emphasis, while Project 2025's tariffs and tax cuts are procyclical-austerity-style under stress — survives intact. The magnitude claim, particularly on transfer-based stimulus, is reduced and explicitly hedged. The diagnosis of Project 2025 as worst-case across all three scenarios strengthens, not weakens, because OBBBA is now enacted at \$4.1T-with-interest rather than projected.

Summary of methodology posture. *Fiscal scoring (this report) and policy scoring (Framework v26) are independent and complementary. Source tiers (A–D) and SRG cross-references are used throughout. Calibrated conservatism applies to every central estimate. The transfer-multiplier literature is engaged honestly per §1.5, with the countercyclical claim hedged on transfer-based components and preserved on government-purchase components. Where v2 overreached, v3 narrows; where v2 was vindicated by enacted policy, v3 strengthens.*

Part 2 — ARA Proposal-by-Proposal Economic Analysis

Each proposal entry carries an FE rating (per §1.3 key), a 10-year fiscal range (net federal impact in billions; – = cost, + = revenue), expected timing of the primary fiscal effect, the documented mechanism, and tier-rated source citations with SRG cross-references. Proposals are presented in the categorical order from Framework v26. Where v3 corrects, supersedes, or supplements v2, the change is flagged inline.

IRS Reform & Pre-Filed Taxes

ECONOMY & TAX

FE RATING	10-YEAR RANGE	TIMING
Revenue+	+\$120B to +\$561B (central +\$124B)	Year 3-10

Closing the \$696B annual gross tax gap (TY2022). Enforcement ROI documented at \$3.18–\$12 per \$1 invested including deterrence. Treasury's 2024 projection: \$561B over 10 years; CBO's more conservative score: \$204B gross / \$124B net. **v3 correction:** v2 referenced "\$20B+ rescissions" — actual figure through Feb 2026 is **~\$53.5B cumulative IRA rescissions** (~67% of original \$79.4B), with ~25% IRS workforce reduction in 2025. Critically, OBBBA (P.L. 119-21) did *not* contain the headline IRS enforcement rescission — major cuts came via separate appropriations vehicles (P.L. 118-5, 118-47, 119-4, plus the Feb 2026 bipartisan deal at –\$11.7B). Yale Budget Lab (2026) finds the full \$80B IRA appropriation would have yielded ~\$637B over 10 years; an IRS-ICE MOU could cost \$147–479B over the same window through undocumented-filer chilling effects.

[TIER A] CBO Pub. 57444 — IRS enforcement cost projections; the conservative central case. (SRG #31) <cbo.gov/publication/57444>

[TIER A] Treasury jy2079 — \$561B 10-year revenue projection (Treasury 2024). (SRG #32)

[TIER A] CBO Pub. 59972 (Feb 2024) — Benchmark enforcement ROI 6.4:1; \$20B rescission → ~\$44B revenue loss / ~\$24B deficit increase 2024–2034. (SRG #308) <cbo.gov/publication/59972>

[TIER A] CBO Pub. 61172 (Jan 2025) — Updated for the \$20B American Relief Act rescission: –\$66B receipts, +\$46B deficit. UPDATES v2. (SRG #309) <cbo.gov/publication/61172>

[TIER A] TIGTA Snapshot Report 2025-IE-R027 (July 2025) — IRS workforce –25% in 2025; 31% of revenue agents departed; SB/SE division –35%. (SRG #310)

[TIER B] Yale Budget Lab, "A Weakened IRS Has Substantial Consequences" (2026) — Full \$80B IRA would have yielded ~\$637B/10yr; IRS-ICE MOU could cost \$147–479B. (SRG #311) <budgetlab.yale.edu/research/weakened-irs-has-substantial-consequences>

[TIER A] Sarin & Summers, NBER WP 26475 — "Shrinking the Tax Gap." Foundational ROI analysis underpinning enforcement-investment central case. (SRG #33) <nber.org/papers/w26475>

Antitrust Enforcement & Corporate Accountability

ECONOMY

FE RATING	10-YEAR RANGE	TIMING
Welfare+	+\$750B to +\$2T welfare (not direct fiscal)	Year 2-10

Not a direct budget measure. Aggregate US markups rose from 21% above marginal cost (1980) to 61% (2016). The 2021 Council of Economic Advisers analysis put the cost at \$1.4T in lost labor income annually. **v3 update:** the most defensible macro-welfare quantification is now De Loecker-Eeckhout-Mongey (SSRN 3837433): aggregate welfare ~9% lower in 2016 than 1980, net of reallocation and selection gains. The same authors' 2025 *Annual Review of Economics* synthesis updates the post-2017 markup literature. **Critical caveat to flag:** the rising-markup narrative is contested by Benkard-Miller-Yurukoglu (2025), which finds the measurement is sensitive to how overhead is treated; v3 cites both sides. Realized enforcement gains are likely modest relative to the structural-breakup counterfactual: in *United States v. Google* (D.D.C., Sept–Dec 2025), Judge Mehta rejected divestiture of Chrome and Android, ordering behavioral remedies only.

[TIER A] De Loecker, Eeckhout & Mongey, "Quantifying Market Power and Business Dynamism" (SSRN 3837433) — Aggregate welfare 9% lower in 2016 vs. 1980; central macro estimate. (SRG #312)

[TIER A] De Loecker & Eeckhout, "The Macroeconomics of Market Power," *Annual Review of Economics* (2025) — Synthesis update of post-2017 markup research. (SRG #313)

[TIER A] Benkard, Miller & Yurukoglu (2025) — Methodological challenge to the rising-markup narrative. **Flag the dispute;** the macro markup finding is contested. (SRG #314)

[TIER A] De Loecker, Eeckhout & Unger, *Quarterly Journal of Economics* (2020) — Aggregate US markup rose from 21% (1980) to 61% (2016). (SRG #34) <academic.oup.com/qje/article-abstract/135/2/561/5739752>

[TIER B] Council of Economic Advisers, Biden WH Archives (2021) — \$1.4T in lost labor income annually attributable to market concentration. (SRG #35)

[TIER B] PIIE Working Paper 18-4 (Furman & Orszag) — Concentration and labor share decline. (SRG #36)

[TIER B] *United States v. Google LLC* (D.D.C., Sept-Dec 2025) — Behavioral remedies ordered; divestiture of Chrome / Android rejected. Realized welfare gain narrows. (SRG #315)

Billionaire Wealth Tax & Digital Services Levy

ECONOMY

FE RATING	10-YEAR RANGE	TIMING
Rev+/Cost	+\$1.9T to +\$2.9T (TPC central; SUPERSEDES PWBM 2021)	Year 1-10

v3 SUPERSEDES the v2 primary citation. Tax Policy Center "Taxing Wealth in the United States" (Feb 2025) is now the most current Tier A revenue estimate, replacing the older PWBM 2021 Warren wealth-tax score as the lead figure. TPC options: 1% above \$50M raises \$1.9T/10yr; 1% above \$50M + 2% above \$100M raises \$2.9T/10yr; flat 1% above \$30M raises \$2.8T/10yr. 85-90% of the burden falls on the top 1%. Saez-Zucman 2021 remains a useful supplement at \$3.0T (with 15% avoidance assumption). PWBM 2021 found GDP -1.2% by 2050 due to capital crowd-out — retain as the long-run dynamic-cost flag.

⚠ CONSTITUTIONAL RISK REMAINS HIGH POST-MOORE

Moore v. United States (June 20, 2024) upheld the Mandatory Repatriation Tax 7-2, but the Court **explicitly declined to resolve whether realization is constitutionally required**. A footnote disclaimed taxes on wealth, holdings, and appreciation. At least four plausible votes are hostile (Alito, Thomas, Gorsuch, plus Barrett's concurrence). Capital flight risk and European wealth-tax failure precedents remain in the modeling. v3 retains the v2 framing that this is the most uncertain estimate in the document.

[TIER A] Tax Policy Center, "Taxing Wealth in the United States" (Feb 2025) — Six options; \$1.9T-\$2.9T/10yr range; 85-90% burden on top 1%. **SUPERSEDES PWBM 2021 as primary.** (SRG #316)
<taxpolicycenter.org/research-reports/taxing-wealth-united-states-issues-and-challenges>

[TIER A] Balkir, Saez, Yagan & Zucman, NBER WP 34170 (Aug 2025) — Top 0.0002% effective tax rate 24% of economic income (2018-2020) vs. 30% population-wide and 45% for top labor earners. Splinter (Aug 2025) provides methodological counterpoint — flag both. (SRG #317) <nber.org/papers/w34170>

[TIER A] PWBM 2021 Wealth Tax — Warren 2%/3%: \$2.1T conventional / \$2.0T dynamic; GDP -1.2% by 2050. Retained for long-run dynamic-cost flag. (SRG #37)

[TIER A] Saez & Zucman 2021 — \$3.0T with 15% avoidance assumption. Supplements TPC. (SRG #38)

[TIER A] *Moore v. United States*, 602 U.S. (June 20, 2024) — 7-2 upheld MRT; Court declined to resolve realization requirement. **Constitutional risk remains high.** (SRG #318)

[TIER B] OECD Net Wealth Taxes (2018) — European wealth-tax failure precedents; capital flight evidence. (SRG #39)

Close Wealth Accumulation Loopholes

ECONOMY

FE RATING	10-YEAR RANGE	TIMING
Revenue+	+\$160B to +\$300B	Year 2-10

Treasury (2021) estimated \$160B+ annually from taxes the top 1% choose not to pay. CBO enforcement investment generates \$204B-\$561B net (see IRS Reform). Offshore tax avoidance is the largest unscored component — CRFB and Treasury converge at roughly \$150-200B/yr achievable with full enforcement.

[TIER A] Treasury (2021) Tax Gap Report — \$160B+ annually from top-1% non-compliance. (SRG #40)

[TIER A] IRS Pub. 5869 — Tax gap composition; enforcement-investment ROI. (SRG #41)

[TIER B] Bipartisan Policy Center (2025) — Offshore tax avoidance scope and enforcement feasibility. (SRG #42)

Ban Congressional Insider Trading

LEGAL & GOVERNANCE

FE RATING	10-YEAR RANGE	TIMING
Neutral	Negligible direct fiscal	Immediate

Immaterial direct fiscal effect. The indirect economic case: reducing regulatory capture is estimated to cost the economy \$1T+ annually in foregone competitive market outcomes (Zingales 2012; PIIE). This is a political-economy argument, not a budget measure. 86% public support per the University of Maryland survey. The Restore Trust in Congress Act (Senators Moody and Gillibrand, January 2026) is the current vehicle.

[TIER A] Zingales, "A Capitalism for the People" (2012) — Regulatory-capture economic cost estimate framework. (SRG #43)

[TIER B] PIIE — Concentration and capture costs. (SRG #44)

[TIER B] Program for Public Consultation, U-Md. — 86% public support across partisan lines. (SRG #45)

[TIER B] Restore Trust in Congress Act (Senators Moody & Gillibrand, Jan 2026). (SRG #119)

Public Option Healthcare Expansion

PHASE II HEALTHCARE

FE RATING	10-YEAR RANGE	TIMING
Rev+/Cost	−\$0 to +\$388B	Year 3-10

CBO 2013 "robust" public option scored \$158B in deficit savings over 10 years; Urban Institute / Choose Medicare Act scored \$388B. RAND (2020): \$7-24B/yr federal savings. Hoover (outlier): +\$700B deficits under weak reimbursement discipline. Real-world: Colorado achieved a 10% premium reduction. CBO 2013 and Urban remain the most recent comprehensive scores — neither has been superseded.

⚠ CRITICAL BASELINE SHIFT — FLAG IN ANY NEW SCORE

OBBA enacted creates a baseline of **+10M uninsured by 2034**; ePTC expiration pushes this to **~15M**. Any new public-option estimate would now be measured against a materially worse counterfactual than the one CBO 2013 used. The directional case for the public option strengthens; the precise fiscal score cannot be inferred from pre-OBBA estimates without re-baselining.

[TIER A] CBO Pub. 41464 (2013) — Robust public option: \$158B deficit savings over 10 years. Most authoritative pre-OBBA score. (SRG #46) cbo.gov/publication/41464

[TIER A] CBO Pub. 57020 (April 2021) — "A Public Option for Health Insurance in the Nongroup Marketplaces: Key Design Considerations." Qualitative design framework, not a numerical score. SUPPLEMENTS. (SRG #319) cbo.gov/publication/57020

[TIER A] CBO Pub. 61734 (Sept 2025) — Permanent ePTC extension: +\$350B deficit / +3.8M insured by 2035; OBBA Title VII Subtitle B Marketplace cuts repeal: +\$272B / +2.9M insured. Nearest-vintage CBO coverage-policy benchmark. (SRG #320) cbo.gov/publication/61734

[TIER B] Urban Institute / Choose Medicare Act — \$388B deficit reduction (10yr). (SRG #47)

[TIER B] RAND RR3153 (2020) — \$7-24B/yr federal savings range. (SRG #48)

[TIER C] Hoover Institution (2020) — +\$700B deficits under weak reimbursement discipline. **Outlier; flag for asymmetric assumption set.** (SRG #49)

[TIER B] Georgetown CCF + KFF — OBBA-enacted uninsured baseline +10M by 2034; ~15M with ePTC expiration. **Critical re-baselining flag for any new score.** (SRG #321)

Universal Government-Funded Healthcare

PHASE III HEALTHCARE

FE RATING	10-YEAR RANGE	TIMING
High Cost	+\$28T-\$34T federal cost; −\$2T to +\$7T NHE	Year 15+

CBO 2020 single-payer working paper: federal subsidies rise \$1.5-3.0T in 2030 alone. National Health Expenditure change: −\$0.7T (savings) to +\$0.3T depending on provider rates. Administrative savings: \$400B/yr (Himmelstein-Woolhandler, *Annals of Internal Medicine* 2020). US spends \$14,885/capita versus the OECD average of \$5,967. Phase III — outcome depends entirely on payment-rate discipline.

[TIER A] CBO Pub. 56811 (2020) — Single-payer federal subsidy estimate; the only full-CBO score. (SRG #50) cbo.gov/publication/56811

Socialized Public Childcare

HEALTHCARE & SOCIAL

FE RATING	10-YEAR RANGE	TIMING
Rev+/Cost	–\$381B gross (BBB) / –\$400B (FY2025 budget); net near breakeven	Year 1-6

CBO BBB score: \$381.5B gross over 6 years. Quebec natural experiment: every \$1 invested returned \$1.05 to province plus \$0.44 to federal Canada — \$1.49 total return. Maternal labor force participation +3% (70,000 workers). PWB US estimate: GDP +0.2% short-run. **v3 adds:** CBO and OMB on the FY2025 President's Budget childcare proposal: \$400B over 10 years for universal childcare, \$200B for universal pre-K. The Yale Budget Lab's April 2026 paper (Eppsteiner / Lee / Ricco) is now the most rigorous post-BBB academic ECEC fiscal feedback estimate: most generous co-pay subsidies raise maternal employment ~6 percentage points, require >500,000 additional FTE care workers, and raise care-worker wages \$3-8/hr. None of the policies fully self-finance; the Provider Tax Credit recovers the largest share.

NEW EVIDENCE — STATE-LEVEL NATURAL EXPERIMENT. *New Mexico became the first state to launch no-cost universal childcare on November 1, 2025 (NMECED). FY26 ECEC budget: \$450M; LFC estimates universal cost could reach \$849.7M at 90% uptake. This is genuinely new evidence not in v2 — first US state-level data on a universal-coverage program will be available within the v3 budget window.*

[TIER A] CBO Pub. 57630 (Nov 2021) — BBB childcare/preschool \$381.5B over 6 years. (SRG #55) <cbo.gov/publication/57630>

[TIER A] CBO/OMB on FY2025 President's Budget childcare proposal — \$400B/10yr universal childcare; \$200B universal pre-K. UPDATES v2. (SRG #322)

[TIER B] Yale Budget Lab, Eppsteiner / Lee / Ricco (April 16, 2026) — Most rigorous post-BBB ECEC fiscal-feedback estimate. Maternal employment +~6pp; +500,000 FTE care workers; care-worker wages +\$3-8/hr. (SRG #323) <budgetlab.yale.edu/news/260416/>

Part 3 — Project 2025 / OBBBA Economic Analysis

This part reframes the v2 Project 2025 / Agenda 47 analysis around enacted policy. The One Big Beautiful Bill Act has been law since July 4, 2025 (Public Law 119-21); the IEEPA tariff schedule was struck by the Supreme Court 6-3 on February 20, 2026; federal workforce reductions have produced both fiscal and broader economic effects now quantified by Partnership for Public Service. Three of v2's four major P2025 subsections require substantial updating; the fourth (deregulation externalities) has new RFF data that strengthens the v2 directional finding.

3.1 OBBBA Enacted — Post-Enactment Scoring Has Converged

The enacted bill's fiscal picture is now cleanly anchored by CBO's February 2026 Budget and Economic Outlook (Pub. 61882) — the first fully integrated post-enactment baseline incorporating dynamic effects. Mainstream modelers converge on a 10-year conventional deficit increase of \$3.2–\$4.5T depending on baseline conventions, with **CBO's \$4.1T (with interest) the standard reference point**. Every credible model except Tax Foundation finds dynamic feedback raises rather than lowers cost. Direction of consensus: OBBBA does not pay for itself, is regressive on a whole-bill basis, and significantly worsens long-run debt sustainability.

[TIER A] CBO, "Estimated Budgetary Effects of Public Law 119-21" (Pub. 61570, July 21, 2025) — Net deficit increase \$3.4T over 2025–2034 (revenues –\$4.5T; direct spending –\$1.1T). **SUPERSEDES all pre-enactment House/Senate estimates including the May 2025 H.R. 1 score.** (SRG #328) <cbo.gov/publication/61570>

[TIER A] CBO, "The Budget and Economic Outlook: 2026 to 2036" (Pub. 61882, Feb 11, 2026) — OBBBA dynamic effect on deficits 2026–2035 = +\$4.7T (incl. macro feedback + debt service). Real GDP +0.7% avg over budget window (peak +0.9% in 2026). Debt held by public: 99% of GDP end-FY2025 → 120% by 2036; surpasses post-WWII record of 106% in 2030; reaches 175% by 2056. Deficit rises from \$1.9T (5.8% GDP) FY2026 to \$3.1T (6.7% GDP) FY2036. **Standard reference for OBBBA throughout v3.** (SRG #329) <cbo.gov/publication/61882>

[TIER A] CBO, "Distributional Effects of Public Law 119-21" (Pub. 61367, Aug 11, 2025) — Bottom decile loses ~3.1% of resources by 2034; top decile gains ~2.7%. Federal taxes & cash transfers +\$3.3T to households net; in-kind transfers (Medicaid/SNAP) –\$0.9T. Health coverage: **+10M uninsured by 2034** (excl. ePTC expiration). **SUPERSEDES** preliminary distributional letters of May 20 and June 12, 2025. (SRG #330) <cbo.gov/publication/61367>

[TIER A] JCT JCX-36-25 / JCX-37-25 (July 29, 2025) — Official post-enactment distribution tables under current-policy and present-law baselines. **SUPERSEDE** earlier H.R. 1 JCT distribution tables. (SRG #331) <jct.gov/publications/2025/jcx-36-25/>

⚠ **BASILINE CONVENTION FLAG — JCT CURRENT-POLICY VS PRESENT-LAW**

The Senate's "current-policy" baseline scores the tax-title cost at **\$715B** vs **~\$4.5T** under present-law baseline — a >6× difference attributable solely to which baseline is treated as the counterfactual. Brookings/Gale and others have flagged this as a budget-convention break. v3 reports both figures and notes the convention used for any cited number.

Penn Wharton, Tax Foundation, Tax Policy Center, Auerbach-Gale, and Brookings/Gale have all published post-enactment analyses converging on the directional finding. Where they diverge is on whether long-run growth is modestly positive (CBO, Tax Foundation, JCT) or negative (PWBM, Yale Budget Lab, Brookings/Gale) — the divergence hinges on capital-shallowing assumptions under high debt.

[TIER A] PWBM, "President Trump-Signed Reconciliation Bill: Budget, Economic, and Distributional Effects" (July 8, 2025) — Conventional 10-yr deficit +\$3.2T; dynamic +\$3.6T (debt drag exceeds growth offset). GDP –0.3% in 10 years; –4.6% in 30 years; wages –0.4% / –3.4%. **Top 10% receives ~80% of total bill value.** **SUPERSEDES** May 2025 House version analysis. (SRG #332) <budgetmodel.wharton.upenn.edu/issues/2025/7/8/>

[TIER B] Tax Foundation, "One Big Beautiful Bill Act Tax Policies: Details and Analysis" — **Critical Feb 2026 revision:** long-run GDP +0.7%, downward from earlier +1.2% due to identified housing-investment treatment error. **Methodological flag:** Tax Foundation excludes debt-drag/crowding-out, which is why TF is the most positive non-partisan modeler. Long-run debt-to-GDP rises to 190% in 35 years even in their optimistic frame. (SRG #333) <taxfoundation.org/research/all/federal/big-beautiful-bill-senate-gop-tax-plan/>

[TIER A] Tax Policy Center, "Distributional Effects of the Tax Provisions in the 2025 Budget Reconciliation Act" — Average tax cut ~\$2,900 in 2026; ~60% of tax benefits accrue to top quintile; ~85% of households receive a 2026 cut, falling to ~70% by 2030 as temporary provisions expire. (SRG #334) <taxpolicycenter.org/tax-model-analysis/distributional-effects-tax-provisions-2025-budget-reconciliation-act>

[TIER A] Auerbach & Gale, "Then and Now: A Look Back and Ahead at the Federal Budget" (working paper, late 2025) — Confirms +\$4.2T 10-yr deficit; 2054 debt-to-GDP 183% as written / 199% permanent / 204% / 233% under endogenous rates. (SRG #335) <eml.berkeley.edu/~auerbach/AG%20Fiscal%20Primer%20final.pdf>

[TIER A] Brookings, Gale/Page/Patel/Pomerleau, "One Big Beautiful Bill? A Preliminary Assessment" (March 23, 2026) — Most authoritative non-CBO retrospective. "Due to weak growth effects, dynamic scores of the Act tend to show higher deficits than conventional scores." (SRG #336) <brookings.edu/wp-content/uploads/2026/03/OBBBA_Preliminary_Assessment_2026-03-23-1.pdf>

[TIER B] CRFB, "OBBBA Dynamic Score Comes In at \$4.7 Trillion" (March 11, 2026) — Reports CBO integrated dynamic figures: \$4.2T dynamic deficit impact 2025–2034. Companion: 30-Year Cost of OBBBA — debt-to-GDP in 2054: 176% as written, 191% if permanent, ~220% if rates persist at current levels and OBBBA permanent. (SRG #337) <crfb.org/blogs/obbba-dynamic-score-comes-47-trillion>

[TIER D] Trump CEA OBBBA analysis — Claims dynamic effects reduce deficit by \$2.1T; GDP up to +3.5%; uses labor supply elasticity 0.75 (vs CBO's 0.24). **Outlier:** flagged as far outside mainstream by CRFB, AEI, and Brookings. Cite only as partisan-administration outlier. (SRG #338)

3.2 Tariffs — The Post-SCOTUS Revenue Collapse

The pivotal February 20, 2026 Supreme Court ruling struck down IEEPA tariffs (6-3), which had constituted ~75% of expected tariff revenue. v2's \$2.0–3.3T tariff revenue projection is partially superseded by post-SCOTUS estimates clustering at **\$668B–\$1.1T over the decade** (Section 232 plus temporary Section 122 only). v2's headline PWBM "–6% GDP / –5% wages / \$22K lifetime household loss" figure modeled the April 8, 2025 maximum-aggression schedule that was never fully implemented and is now legally precluded. This figure is reframed in v3 as *counterfactual* rather than current policy. Current actual-policy long-run GDP estimates cluster at **–0.1% to –0.3%** (Tax Foundation, Yale Budget Lab) — a meaningful methodological softening v3 cannot avoid acknowledging.

△ PWBM –6% GDP / \$22K LIFETIME LOSS — REFRAMED AS COUNTERFACTUAL

PWBM has not formally republished the April 2025 long-run macro brief. The –6% GDP / –5% wages / \$22K household-loss figure cited in v2 applies to a maximum-aggression tariff schedule that was never fully implemented and is now legally barred by the Feb 20, 2026 SCOTUS ruling. v3 retains the figure for historical context but flags it as counterfactual; the current-policy estimate is materially smaller. PWBM's February 2026 SCOTUS analysis projects up to **\$175B in IEEPA refunds**; CBP data suggests up to \$90B of FY2025 collections may need refunding.

[TIER B] Tax Foundation, "Tracking the Impact of the Trump Tariffs & Trade War" (updated April 7, 2026) — CY2025 customs duties \$264B (vs \$79B in 2024); average effective tariff rate 7.7% (highest since 1947). Post-SCOTUS revenue projection (Section 232 + temporary Section 122 only): \$668B conventional / \$522.8B dynamic / \$386.8B net of retaliation over 2026–2035. Long-run GDP –0.2% (Section 232 only); –141,000 FTE jobs from imposed retaliation. **PARTIALLY SUPERSEDES v2.** (SRG #339) <taxfoundation.org/research/all/federal/trump-tariffs-trade-war/>

[TIER B] CRFB, "Tariff Revenue Soars in FY 2025 Amid Legal Uncertainty" (updated April 24, 2026) — FY2025 customs duties: \$195B final (+150% YoY). Updated 10-year projection post-SCOTUS: \$900B FY2025–35, down ~\$2.2T from pre-SCOTUS \$3.1T. **~\$90B of \$195B FY2025 collections may need refunding** per CBP data. (SRG #340) <crfb.org/blogs/tariff-revenue-soars-fy-2025-amid-legal-uncertainty>

[TIER A] PWBM Effective Tariff Rates and Revenues series (through April 15, 2026) — Cumulative new tariff revenue Jan 2025–Feb 2026: \$224.8B. Effective tariff rate peaked 10.91% Oct 2025; 8.9% Feb 2026 post-SCOTUS. China ETR Feb 2026: 31.6%. USMCA exemption uptake: 86.3% by Feb 2026 (was <50% in 2024). (SRG #341)

[TIER A] Yale Budget Lab, "State of US Tariffs: April 8, 2026" — Pre-substitution ETR 11.8%; consumer price impact 1.1% short-run = \$1,500/household income loss (Section 122 extension scenario). 10-year fiscal: \$1.1T conventional / \$1.0T dynamic (expiration); \$1.7T / \$1.6T (extension). Long-run GDP –0.1% to –0.17%. (SRG #342) <budgetlab.yale.edu/research/state-us-tariffs-april-8-2026>

[TIER A] Tax Policy Center Tariff Tracker — Average effective rate 10%; revenue projection \$911B FY2026–35; 2026 average household tariff burden \$2,100 (notably higher than Tax Foundation's \$700–1,500 range; methodological difference). (SRG #343) <taxpolicycenter.org/features/tracking-trump-tariffs>

[TIER A] PIIE WP 25-13, McKibbin/Noland/Shuetrim, "Modeling the Macroeconomic Consequences of Trump's Trade Policies" (June 2025) — G-Cubed multi-scenario modeling. 15-pp universal: \$3.2T over decade no retaliation, \$1.5T with retaliation; 20-pp + retaliation: only \$791B (Laffer-curve dynamic). (SRG #344) <piie.com/sites/default/files/2025-06/wp25-13.pdf>

[TIER A] Federal Reserve Board, Minton & Somale, "Detecting Tariff Effects on Consumer Prices in Real Time – Part II" (April 8, 2026) — Tariffs through Nov 2025 raised core goods PCE prices by 3.1% through Feb 2026, contributing +0.8% to overall core PCE. **"Tariffs explain the entirety of the excess core goods inflation since January 2025."** Pass-through is "effectively complete." (SRG #345) <federalreserve.gov/econres/notes/feds-notes/detecting-tariff-effects-on-consumer-prices-in-real-time-part-II-20260408.html>

[TIER A] Cavallo, Llamas & Vazquez, NBER WP 34496 (2025) — Retail tariff pass-through ~20% short-run; cumulative +0.7 pp contribution to all-items CPI by Sept 2025. (SRG #346) <nber.org/papers/w34496>

[TIER A] Gopinath & Neiman, NBER WP 34620 (2026), "The Incidence of Tariffs" — Sept 2025 statutory trade-weighted tariff 27% (highest in 100+ years), but actual implemented rate ~half due to lags and exemptions. **Pass-through to US import prices ~94% in 2025** (vs 80% in 2018–19) — Americans bear the burden, not foreign exporters. (SRG #347) <nber.org/papers/w34620>

[**TIER B**] AEI, "Evaluating the Impact of Tariffs on US Agriculture a Year After Liberation Day" (April 2026) — Overall US ag exports –3% in 2025; soybean exports to China –72% (7.4M MT vs 27.4M MT prior year); US beef exports to China –90%+ monthly. Only China imposed sustained retaliation; EU retaliation suspended; Canada removed most retaliation Sept 1, 2025. (SRG #348) [aei.org/research-products/report/evaluating-the-impact-of-tariffs-on-us-agriculture-a-year-after-liberation-day/](https://www.aei.org/research-products/report/evaluating-the-impact-of-tariffs-on-us-agriculture-a-year-after-liberation-day/)

3.3 Federal Workforce — \$165.6B Economy-Wide

v2's headline figure (~\$71B) for federal workforce overhaul costs is now the narrower fiscal subset; the broader economy-wide figure has nearly tripled. Partnership for Public Service's Federal Harms Tracker (April 9, 2026) puts the new headline at **\$165.6 billion**. Components: \$53.2B disengagement productivity loss; \$94.6B science-grant cuts (multiplier-based GDP estimate); \$4.5B DRP payments to ~137,000 participants (\$32,850/person); \$763.9M RIF severance for ~10,400 employees; \$443.9M probationary admin leave. v3 cites both figures with cost-type distinction (fiscal vs economy-wide). The federal civilian workforce stood at 2,028,138 in February 2026 — the lowest level since approximately 1966.

[**TIER A**] Partnership for Public Service, Federal Harms Tracker (April 9, 2026) — **NEW headline economy-wide cost: \$165.6 billion**. Components: \$53.2B disengagement productivity loss; \$94.6B science-grant cuts; \$4.5B DRP payments; \$763.9M RIF severance; \$443.9M probationary admin leave. **SUPERSEDES the v2 \$71B figure** as the broader framing; both should be cited with cost-type distinction (fiscal vs economy-wide). (SRG #349) ourpublicservice.org/federal-harms-tracker/cost-to-your-government/

[**TIER A**] OPM workforce data via PPS / Pew Research / FedTools — Federal civilian workforce (Feb 2026): 2,028,138 (lowest since ~1966). Net positions lost since Jan 20, 2025: 271,825 (–11.8%) in 13 months. 2025 total departures: 348,219 (+80.8% vs 2024). OPM retirement claims backlog peaked 65,237 in February 2026 (record). (SRG #350)

[**TIER B**] Economic Policy Institute — Federal employment fell 162,000 in October 2025 alone; cumulative federal job losses Jan-Oct 2025 = 271,000; private-sector job growth slowed to ~44k/month (vs 130k/month avg in 2024). DC region federal employment fell 53,800 (–14.2%) in 2025. Flag: EPI is left-of-center; methodologically transparent. SUPPLEMENTS PPS with regional/macro spillovers. (SRG #351)

epi.org/blog/federal-layoffs-trigger-a-sharp-slowdown-in-job-growth-unemployment-rises-to-highest-rate-since-2021/

[**TIER A**] GAO-26-108719, "Federal Agency Workforce Changes: Update for January to June 2025" — Confirms staffing decline at nearly all 24 CFO Act agencies. Methodological caveat: GAO is descriptive, not evaluative on cost. (SRG #352)

gao.gov/products/gao-26-108719

[**TIER A**] OPM Final Rule 91 FR 5580, "Improving Performance, Accountability and Responsiveness in the Civil Service" (Schedule Policy/Career, effective March 9, 2026) — OPM official estimate: ~50,000 positions to be reclassified. Plaintiffs in *NTEU v. Vought* (D.D.C.) argue the actual number could be far higher; as of May 2, 2026, no confirmed count of post-conversion positions has been published — flag as reporting gap. (SRG #353)

[**TIER B**] CRFB, "Potential Savings from Shrinking the Federal Workforce" — Pre-2025 estimate: 10% civilian reduction would save ~\$350B over 10 years; 25–33% reduction \$900B–\$1.2T. **Counter-figure to PPS cost estimates, but ignores transition costs**. No CBO score of the 2025 RIFs/DRP exists — CBO has stated inability to score under Byrd Rule. (SRG #354)

crfb.org/blogs/potential-savings-shrinking-federal-workforce

3.4 Deregulation — Estimates Diverge Sharply by Source

Deregulation fiscal estimates diverge by an order of magnitude depending on the source. Resources for the Future provides the cleanest non-partisan economic counter-estimate to administration claims: the EPA Carbon Pollution Standards repeal generates ~\$75B NPV in avoided compliance costs against \$157–476B NPV in health damages and \$109–497B NPV in climate damages — for a net societal cost of repeal of \$198–855B. Health damages alone are 2.3–4× avoided compliance costs. The combined CPS repeal + OBBBA effect: net +\$67–97/year higher household electricity bills in the 2030s. The financial-stability deregulation track is separately quantified by the Federal Reserve and the Office of Financial Research. Administration-aligned estimates (WH CEA, OMB) are tier-flagged and used only with explicit advocacy framing.

[**TIER A**] Resources for the Future, Roy & Palmer, "Hidden Costs of Repealing EPA's Carbon Pollution Standards" (IB 25-10, August 6, 2025) — Avoided compliance cost ~\$75B NPV; health damages \$157–476B NPV; climate damages \$109–497B NPV. **Net societal cost of repeal: \$198–855B; health damages alone are 2.3–4× avoided compliance costs**. Combined CPS repeal + OBBBA effect: net +\$67–97/year higher household electricity bills in the 2030s. SUPERSEDES EPA's June 2025 RIA cost-benefit analysis as the cleanest non-partisan counter-estimate. (SRG #355) media.rff.org/documents/IB_25-10.pdf

[**TIER A**] Federal Reserve, Financial Stability Report (Nov 2025) — Identifies elevated policy-uncertainty risk; hedge-fund leverage at/near decade high; AI-driven sentiment cited by ~30% of NY Fed market contacts as top near-term risk. Does not explicitly score deregulation fiscal cost. (SRG #356) federalreserve.gov/publications/files/financial-stability-report-20251107.pdf

[TIER A] Office of Financial Research 2025 Annual Report (Nov 19, 2025) — Hedge-fund positions +\$1T to ~\$4.1T in 2025; CRE office delinquencies 11.1% CMBS; 9M+ student loan borrowers delinquent. Treasury announced March 2026 RIFs at OFR proposing 60% staff cut — relevant fiscal-feasibility flag. (SRG #357) <financialresearch.gov/annual-reports/files/OFR-AR-2025.pdf>

[TIER A] CBO score, OBBBA Section 50003 (CFPB funding) — Reduces CFPB funding cap from 12% to 6.5% of Fed's 2009 operating expenses. **Reduces direct spending by \$3.9B over 2026-2034.** The cleanest neutral fiscal score on this provision. The CEA's \$237-369B "cost of CFPB to consumers" claim is administration-aligned and methodologically critiqued by Levitin (Georgetown Law) as "bizarre and contorted." (SRG #358) <cbo.gov/publication/61379>

[TIER D] White House CEA, "The Economic Benefits of Current Deregulatory Efforts" (June 2025) and OMB/OIRA Year-End Regulatory Accounting (Dec 2025) — Claim 0.29-0.78pp higher annual GDP growth; \$1.1-2.9T 10-year deficit reduction via growth; \$211.8B FY2025 net savings. **Methodological flag:** figures rely on agencies' own ex-ante cost estimates of original rules and do not net out foregone benefits (health, environmental, consumer-protection). **Cite only with explicit advocacy framing.** (SRG #359)

3.5 Project 2025 / OBBBA — Updated Aggregate Fiscal Impact (v3)

The aggregate table below reflects the post-enactment OBBBA score, the post-SCOTUS tariff revenue collapse, the broader federal-workforce economy-wide cost, and the RFF deregulation externality estimates. Compared with v2, the tariff revenue offset shrinks substantially and OBBBA cost crystallizes at the high end of the prior projected range. The directional finding (P2025 worst-case across all three scenarios) **strengthens, not weakens.**

Component	Low	Central	High	v3 Source / Note
OBBBA Tax Cuts (enacted)	−\$3.2T	−\$4.1T (with int.)	−\$5.5T	CBO 61882 / 61570; Auerbach-Gale 2025; PWBM Jul 2025; Brookings/Gale Mar 2026.
Tariff Revenue (post-SCOTUS)	+\$0.4T	+\$0.7T	+\$1.1T	Tax Foundation Apr 2026; Yale Budget Lab Apr 2026; CRFB Apr 2026. v2 +\$2.0-3.3T partially superseded after Feb 20, 2026 IEEPA ruling.
Tariff GDP / Consumer Cost	−\$0.3T	−\$0.8T	−\$1.5T	Long-run GDP −0.1 to −0.3% (TF, YBL); pass-through ~94% (Gopinath-Neiman 2026); Fed Apr 2026 confirms tariff-driven inflation.
Federal Workforce (econ-wide)	−\$71B	−\$165.6B	−\$200B +	PPS Federal Harms Tracker Apr 2026. v2 \$71B is fiscal subset; v3 headline is broader economy-wide cost.
Deregulation Externalities	−\$0.2T	−\$0.5T (RFF central CPS only)	−\$1.4T	RFF IB 25-10 (Aug 2025) net cost of CPS repeal \$198-855B; broader deregulation sources diverge by tier; CEA outlier flagged.
Total 10-Year Fiscal/Welfare	−\$3.4T	−\$5.0T to −\$6.0T	−\$8.0T+	Updated v3 aggregate. Compare to v2: low −\$1.65T / central −\$7.75T / high −\$15.55T. v3 narrows on extreme high end (tariff offset / GDP cost reduced) but firms central estimate around enacted-OBBBA score.

Source: CBO Pub. 61882 (Feb 2026) anchors OBBBA central case at \$4.1T with interest. PWBM July 2025 (post-enactment): conventional +\$3.2T / dynamic +\$3.6T. Tariff figures reflect post-SCOTUS environment per Tax Foundation, Yale Budget Lab, CRFB, and PWBM April 2026 data. Workforce figures per PPS Federal Harms Tracker April 2026 with both narrower fiscal subset (\$71B) and broader economy-wide (\$165.6B) footed.

Part 4 — DNC 2024 Platform Economic Analysis

v2 reported the DNC 2024 platform at the aggregate level only, anchored on the PWBM Harris analysis. v3 reframes around the more comprehensive CRFB October 2024 score, adds component-level breakdown to match the structure used for ARA in Part 2 and OBBBA in Part 3, and incorporates a new IRA-preservation counterfactual section quantifying what the DNC 2024 climate provisions would have delivered against the post-OBBBA-rescission baseline. The directional v2 finding stands: DNC 2024 is the lowest-variance, lowest-effect package of the three.

4.1 Aggregate Score — CRFB Replaces PWBM as Primary Anchor

The PWBM Harris analysis (+\$1.2T conventional / +\$2.0T dynamic) cited in v2 is materially narrower than CRFB's October 2024 comprehensive score (**+\$3.95T central, range \$300B low / \$8.30T high**). The difference is which line items are scored, not modeling differences. CRFB includes the under-\$400K TCJA extension (~\$3T central) that PWBM excluded. v3 anchors on CRFB as the more defensible aggregate, while retaining PWBM for long-run dynamic-feedback flagging (GDP −1.3% by 2034; −4% by 2054).

[TIER B] CRFB, "Fiscal Impact of the Harris and Trump Campaign Plans" (October 2024) — **Harris central +\$3.95T (range \$0.3T–\$8.3T)**; debt-to-GDP ~133% by FY2035. **v3 NEW PRIMARY anchor for DNC 2024.** (SRG #27)

crfb.org/papers/fiscal-impact-harris-and-trump-campaign-plans

[TIER A] PWBM, "2024 Harris Campaign Policy Proposals" (Aug 26, 2024) — Harris plan: +\$1.2T conventional / +\$2.0T dynamic deficits over 10 years. GDP −1.3% by 2034, −4% by 2054. **Approximately one-fifth the deficit impact of the Trump plan.** Retained for dynamic-feedback flag. Narrower scope than CRFB. (SRG #360)

budgetmodel.wharton.upenn.edu/issues/2024/8/26/harris-campaign-policy-proposals-2024

4.2 Component Breakdown (NEW in v3)

Tax credits — CTC + EITC

The largest single component of the DNC 2024 platform. PWBM Aug 26, 2024: CTC expansion to \$3,000/\$3,600 = −\$1.662T; \$6,000 newborn credit = −\$132B; EITC expansion = −\$126B; subtotal ~\$1.92T over 10 years. CRFB's comparable bundle (CTC + EITC) lands at −\$1.40T central FY2026–2035. Tax Policy Center (Oct 10, 2024) puts the combined CTC + EITC + first-time homebuyer credit at approximately \$2T over 10 years; >70% of households earning ≤\$113K would benefit from at least one. Distributional skew: tax credits concentrate among low- and middle-income households, the inverse of the OBBBA distribution shown in §3.1.

[TIER A] PWBM Aug 26, 2024 — CTC expansion to \$3,000/\$3,600: −\$1.662T; \$6,000 newborn: −\$132B; EITC: −\$126B. Subtotal ~\$1.92T/10yr. (SRG #361) budgetmodel.wharton.upenn.edu/issues/2024/8/26/harris-campaign-policy-proposals-2024

[TIER B] CRFB Oct 28, 2024 — CTC + EITC bundle: −\$1.40T central (FY2026–2035). (SRG #362)

[TIER A] Tax Policy Center, Gleckman (Oct 10, 2024) — CTC + EITC + first-time homebuyer combined ~\$2T/10yr. >70% of households earning ≤\$113K benefit from at least one. (SRG #363)

taxpolicycenter.org/taxvox/key-harris-tax-credits-would-largely-benefit-low-and-middle-income-households

Housing affordability

PWBM scored the \$25,000 first-time homebuyer credit (4-year duration) at −\$138B/10yr, supporting an estimated 1.4M buyers per year. CRFB's broader housing bundle (homebuyer credit + \$40B innovation fund + LIHTC + NHTC + builder incentives) lands at −\$250B central, with a low of \$200B and a high of \$500B if the homebuyer credit is made permanent. Tax Foundation puts combined housing tax credits at ~\$223B (2025–2034 conventional).

[TIER A] PWBM — \$25K first-time homebuyer credit (4-year): −\$138B/10yr; supports 1.4M buyers/yr. (SRG #364)

[TIER B] CRFB — Housing bundle (homebuyer + \$40B innovation fund + LIHTC + NHTC + builder incentives): −\$250B central; low \$200B / high \$500B if homebuyer credit permanent. (SRG #365)

[TIER B] Tax Foundation — Housing tax credits combined ~\$223B (2025–2034 conventional). (SRG #366)

Healthcare — ACA enhanced premium tax credits

The most authoritative score on the platform's healthcare centerpiece is CBO's September 2025 publication: permanent ePTC extension scores +\$350B deficit over FY2026–2035, covering an additional 3.8M people by 2035. The KFF calculator (Oct 29, 2025) finds ePTC expiration would cause average premiums +114% (~\$1,016/year) for marketplace enrollees. The Commonwealth Fund (Oct 2025) projects ePTC expiration causing 7.3M to lose ACA

coverage in 2026 (4.8M becoming uninsured) and approximately 340,000 jobs lost. This is the v3 baseline for comparing the DNC 2024 healthcare position against the OBBBA-enacted counterfactual.

[TIER A] CBO Pub. 61734 (Sept 2025) — Permanent ePTC extension: +\$350B deficit FY2026–2035; +3.8M insured by 2035. Most authoritative score on this provision. **Same source as Public Option baseline-shift flag in §2 (Proposal 6).** (SRG #320) cbo.gov/publication/61734

[TIER A] KFF calculator (Oct 29, 2025) — ePTC expiration causes average premium +114% (~\$1,016/year) for marketplace enrollees. (SRG #367)

[TIER B] Commonwealth Fund (Oct 2025) — ePTC expiration causes 7.3M to lose ACA coverage in 2026 (4.8M become uninsured); ~340,000 jobs lost. (SRG #368) commonwealthfund.org/publications/issue-briefs/2025/oct/expiring-premium-tax-credits-lead-340000-jobs-lost-2026

Drug pricing

CRFB central +\$250B savings over 10 years from extending IRA drug-negotiation authority. CBO scored the IRA negotiation framework at \$98.5B in deficit reduction; this figure is now reduced by approximately \$8.8B due to the OBBBA orphan-drug expansion (which exempted additional drug categories from negotiation).

[TIER B] CRFB drug pricing analysis — Central +\$250B savings over 10 years from extended negotiation authority. (SRG #369)

[TIER A] CBO IRA drug negotiation original score \$98.5B (now reduced by ~\$8.8B due to OBBBA orphan-drug expansion). (SRG #60) cbo.gov/publication/58850

4.3 IRA-Preservation Counterfactual (NEW in v3)

A meaningful component of the DNC 2024 platform was IRA preservation. OBBBA rescinded or accelerated the phase-out of the major IRA energy provisions (per §2 Proposal 9 and §3.1 above). v3 documents what preservation would have delivered, drawing on three independent post-OBBBA modeling exercises. These are counterfactual estimates, not current-law projections — but they quantify what the platform difference looks like when the analysis is conducted at the modeling-tier level rather than at slogan level.

[TIER B] REPEAT Project, Princeton (July 2025) — Post-OBBBA emissions trajectory ~3% below current levels by 2030 vs. **42% reduction under preserved IRA**. Cumulative gap 2026–2030: ~7 billion tons CO₂e. Community investment loss: ~\$500B in cumulative capital investment loss in U.S. electricity & clean fuels by 2035. (SRG #370) repeatproject.org/

[TIER B] Energy Innovation, "Final Analysis: Economic Impacts of OBBBA Energy Provisions" (July 2025) — OBBBA cuts cumulative GDP **\$980B–\$1.1T through 2034** vs. preserved IRA; 760,000 jobs lost by 2030; wholesale electricity prices +25% by 2030. Quantifies what the DNC 2024 IRA-preservation position would have prevented. (SRG #371)

[TIER B] Rhodium Group Taking Stock 2025 — Post-OBBBA: 26–35% reduction below 2005 by 2035 (vs 38–56% under preserved IRA). (SRG #372)

Why this matters for the v3 comparison. When the three platforms are compared on tariffs and tax cuts alone, the DNC 2024 position appears modest against P2025's aggression. When the comparison includes climate and energy investment, the DNC 2024 platform represents a \$980B–\$1.1T cumulative GDP differential — comparable in magnitude to the OBBBA tax cuts themselves, in the opposite direction. This is the strongest single argument for treating the DNC 2024 platform as something other than "lowest-effect."

4.4 DNC 2024 — Aggregate Fiscal Impact

Component	Low	Central	High	v3 Source / Note
CTC + EITC bundle	–\$1.4T	–\$1.6T	–\$1.92T	PWBM Aug 2024 (\$1.92T) and CRFB Oct 2024 (\$1.40T) bracket the range.
Housing affordability	–\$138B	–\$250B	–\$500B	PWBM homebuyer alone \$138B; CRFB bundle \$250B central; high if permanent.
ACA ePTC permanent	–\$300B	–\$350B	–\$420B	CBO Pub. 61734 (Sept 2025) anchors central; +3.8M insured.
Drug pricing extension	+\$98B	+\$250B	+\$300B	CBO IRA score base (now \$89.7B post-OBBBA orphan-drug); CRFB extension \$250B.

Component	Low	Central	High	v3 Source / Note
IRA-preservation (avoided GDP loss)	+\$500B	+\$1.0T	+\$1.1T	Energy Innovation cumulative GDP differential through 2034. Counterfactual.
Total 10-Year Net (CRFB-anchored)	+\$0.3T	+\$3.95T (CRFB central)	+\$8.30T	CRFB Oct 2024 aggregate. PWBM narrower at +\$1.2T conv / +\$2.0T dynamic.

Source: CRFB October 2024 anchors the central aggregate at +\$3.95T. PWBM August 2024 (Harris): +\$1.2T conventional / +\$2.0T dynamic. Component figures per CBO Pub. 61734, PWBM Aug 2024, CRFB Oct 2024, and Tax Policy Center Oct 2024. IRA-preservation row is counterfactual relative to enacted OBBBA, sourced from Energy Innovation; included to show the magnitude of the platform difference on climate and energy.
